Field of the Invention The present invention relates to a power supply device having a plurality of power supplies each of which outputs a power supply output voltage, and to a power supply circuit provided in each of the plurality of power supplies. 2. Description of the Related Art Power supply devices including power supplies each of which outputs a power supply output voltage are known. In general, the power supply device includes a power supply output terminal connected to the outside of the device, and a power supply output circuit that outputs the power supply output voltage from the power supply output terminal. The power supply output circuit includes a plurality of power supplies, and each power supply outputs a power supply output voltage. In such a power supply device, for example, when a power supply output voltage of one of the power supplies is dropped to a lower voltage than that of the other power supplies, a problem arises in that the power supply output voltage of the power supply in the power supply output circuit in which the power supply voltage is dropped becomes lower than a predetermined voltage. In order to solve this problem, a power supply device including a power supply output circuit including a plurality of power supplies is proposed. In such a power supply device, the power supply output circuit is divided into a plurality of groups, and each group is provided with a different power supply output voltage. For example, a power supply device is known in which a power supply output circuit is divided into two groups, and each group includes a first power supply, a second power supply, and a third power supply, and in which a power supply output voltage is output from the first power supply, the second power supply, and the third power supply, respectively. In this power supply device, the first power supply, the second power supply, and the third power supply are 82157476af
